## ACKNOWLEDGEMENTS

The 2011 data was compiled and recorded by Carol Beaulieu with assistance from Virginia Wittrock and others. Miss Beaulieu was responsible for the monitoring of the site while instrument maintenance was carried out by the personnel of the Alternative Energy \& Manufacturing/Development Engineering of the Saskatchewan Research Council (SRC). Virginia Wittrock, Elaine Wheaton, and Dale Young assisted with the proofreading and editing of this report. Consultations with Larry Flysak of the Meteorological Service of Canada (MSC), Saskatoon, SK, were most helpful in verifying and comparing data.

This report is being provided for informational purposes only. While the Saskatchewan Research Council believes this report to be accurate, it may contain errors or inaccuracies. SRC assumes no responsibility for the accuracy or comprehensiveness of this data and reliance on this data is entirely at the user's own risk.

Please be aware that our data is subject to ongoing quality assurance reviews that may result in minor changes and updates to some values in our reports, including past reports. If you notice errors in our reports, please contact us so that we may correct them.

Information and data contained in this report shall not be published, copied, placed in a retrieval system or distributed whole or in part without prior written consent of the Saskatchewan Research Council. All references made to this report shall be acknowledged.

Enquiries concerning the SRC Climatological Reference Station (CRS), its data, measurement programs and publications, or becoming a sponsor are most welcome. For further information contact:

## SASKATCHEWAN RESEARCH COUNCIL

 CLIMATE REFERENCE STATION SUPPORTERS, 2011 WE GRATEFULLY ACKNOWLEDGE THE SUPPORT OF THE FOLLOWING:

## CLIMATE REFERENCE STATION HISTORY

Meteorological observations at or near Saskatoon were first taken by the Royal Northwest Mounted Police in 1889 with the recording of temperature. There is some disagreement in the early records as to the exact location of the weather observing point, but the majority of the evidence indicates $52^{\circ} 15^{\prime} \mathrm{N}, 106^{\circ} 20^{\prime} \mathrm{W}$, elevation 480 m above sea level as the most probable location. This would place it at Clark's Crossing on the South Saskatchewan River, approximately 16 km northeast of the centre of the City of Saskatoon. At that time, there was a settlement at Clark's Crossing as well as 10 to 15 families on either side of the river where Saskatoon is now located.

Little is known about the very early observers; however, the records do show that Major T.H. Keenan took observations from March 1892 until March 1895, and Mr. George Will was the observer from January 1897 until April 1897. It is thought that T. H. Copeland was involved in the observational programme from 1895 to May 1, 1901, at which time it was taken over by Mr. Eby, Sr. Mr. Eby, Sr. recorded the observations until his death in 1921, at which time his daughter, Miss E.S. Eby, continued to record the observations. Her brother, Mr. J.M. Eby, recorded the observations beginning in April 1931 until the station closed on October 31, 1942. The Eby station recorded temperature, precipitation and weather notes on fog, thunderstorms, winds and any unusual weather phenomena. Reports were made twice daily, morning and evening.

In 1916, a climatological station was established by the Physics Department of the University of Saskatchewan and continuous observations were kept twice daily until January 15, 1965. The longtime observer was Mr. Sidney Cox. The Saskatchewan Research Council inherited the programme in the fall of 1963 and moved it to the newly established Climatological Reference Station at latitude $52^{\circ} 09^{\prime} \mathrm{N}$, longitude $106^{\circ} 36^{\prime} \mathrm{W}$ and elevation 497 m asl ${ }^{1}$. The first observer was Terry Beck followed three years later by Orville Olm. ${ }^{2}$ In 1967, Joe Calvert became the primary observer until his retirement in 1983. Ray Begrand succeeded Mr. Calvert until 1988 when Virginia Wittrock became the primary observer. Since 1992, the primary observer has been Carol Beaulieu assisted by Virginia Wittrock.

In the summer of 1992, the CRS began to be converted to an automated system of data collection with the installation of a Campbell Scientific data logger and automatic sensors. The updating, replacing, re-installing and adding of new sensors began in 2009 and will continue during 2012. Elements presently recorded at the site are temperature, precipitation, wind, solar radiation, relative humidity, barometric pressure, soil temperature and snow-on-the-ground (manual recordings). Temperature, precipitation and bright sunshine data are submitted to Environment Canada.
${ }^{1}$ Christiansen 1970; Environment Canada 1975; ²Olm 2001

> Nlr. Sames Eby was one of the original members of the Temperance Colony Society. He filed his homestead in 1882 and returned with his family in 1883. He was the first president of the school board and served as the township superuisor for Natara. While riding a horse in 1890, he was struck by lightning and was a partial invalid thereafter. In 1901, he and his daughter moved to Nutara and James served as a Federal Meteorologist for the next 20 years until hisdeath in 1921 at the age of 77 . He was buried, next to his wife, in the Natara pioneer cemetery.'

## WHAT IS THE CLIMATE REFERENCE STATION?

The Saskatchewan Research Council's Climate Reference Station (SRC CRS) at Saskatoon is classified as a principal climatological station with supplementary climatological observations. ${ }^{1}$ A reference climatological station's data are intended for the purpose of determining climatic trends. This requires long periods (not less than thirty years) of homogeneous records, where man-made environmental changes have been or are expected to remain at a minimum. Ideally the records should be of sufficient length to enable the identification of secular changes of climate ${ }^{2}$. At our station, half-hourly readings are taken of elements which include temperature, precipitation amount, humidity, wind, and atmospheric pressure. Our supplemental observations include rainfall intensity, soil temperature, bright sunshine and solar radiation. High quality and consistent climatological observations are maintained providing data sets to meet the current concerns of the effects of climatic change and increased variability.

## Purpose and Benefits

The purpose of the SRC CRS is to provide a record of observed meteorological elements in order that the climate of the area and its changes can be accurately documented and described. Climatological data have assumed new importance as a result of social and environmental issues in which climate is a dominant factor. Climatological information assists in realizing new technological opportunities and social changes. It is necessary and valuable for areas such as agriculture, forestry, land use and facility placement, water and energy resources, health and comfort.

The CRS also allows us to:

- evaluate long term climate trends - early warning system for increased frequencies of extreme events such as drought, floods, etc.;
- determine the impacts of climate events on society, economy, health, and ecosystems - e.g. intense rainfall causing flooding and property damage, heat stress with its implications for health;
- do value-added research;
- be part of regional, national and global networks in an important agricultural and ecological area;
- facilitate development of additional programs - e.g. air quality, biodiversity, and climate change monitoring;
- have roles in various programs within SRC including spray drift work, Boreal Ecosystem Atmosphere Study (BOREAS), and collaborative research with the Western College of Veterinary Medicine and the College of Agriculture, University of Saskatchewan, for example; and
- provide climate data to accident studies, agricultural sectors, authors, building science, chemical companies, construction firms, governments, insurance agencies, lawyers, media, recreation facilities, schools, tourism groups, transportation studies, universities, wildlife studies, and interested individuals.

## Goals

The goals of the Climate Reference Station are first, to maintain the high quality of data gathered over its more than forty-five years of existence at its current location and, second, to continue to monitor a large variety of elements. These various elements combined with the long-term collection period as well as the stable location allow CRS to be an extremely valuable climate information collection station.

[^0]
## ACTIVITIES ASSOCIATED WITH THE SASKATOON CLIMATE REFERENCE STATION, 2011

Beginning in January, the rural school of South Corman park again requested a presentation on weather and climate for their 28 children in grades 3 and 4. In March, Holliston Public Elementary school hosted the sixth year of the SPLIT programme (Schools Plant Legacy in Trees). They requested a presentation on climate for their kindergarten to grade 8 participants as one of their six areas of interest. Approximately 255 students received hands-on experience with the weather instruments or a computer presentation highlighting Saskatoon's climate; past, present and future and why consideration of the climate is necessary for the planning of the urban landscape.

CRS continued the site renovations. New instruments (soil moisture, snow depth), replacement sensors (temperatures) new electrical wiring (gopher proof we hope) and a new data logger have been installed. Projected for 2012 is continued instrument recalibration and if warranted, replacement. Data collection will be further automated.

CRS continues to partner with other organizations. The University of Saskatchewan tested their air monitoring equipment in October and November at our site.

## SUMMARIES FOR 2011 Overview

Data concerning temperature, precipitation, wind speed and direction, bright sunshine, solar radiation, and soil temperatures, recorded at the Saskatchewan Research Council (SRC) Climate Reference Station (CRS) $\left(52^{\circ} 09^{\prime} \mathrm{N}, 106^{\circ} 36^{\prime} \mathrm{W}, 497 \mathrm{~m}\right.$ asl), are presented for the year 2011 and compared with the long-term (circa 1900-2010) and standard-period/normal (1981-2010) records.

January to March 2011 lived up to expectations of bygone winters with six days below minus $30^{\circ} \mathrm{C}$ and the average temperatures near or below normal. Temperatures, April through to August, were near normal with September and October well above their normal values. In fact, out of 10 days with temperatures above $30^{\circ} \mathrm{C}$, seven occurred in September including the yearly extreme of $35.0^{\circ} \mathrm{C}$. The growing season of 126 days, began on May $11^{\text {th }}$ and ended on Sept $13^{\text {th }}$. The garden was cleared and tools were carefully put away; the winter tires were installed and the block heaters checked; the parkas, mitts, toques, scarves and fleece-lined boots were at the ready by the front door; and then we waited and waited and waited some more for winter to arrive. It never did; at least not as die-hard, I-remember-when .... true prairie winter survivors were expecting. The new winter of November and December was one big disappointed for those who like to grumble and carp about Saskatchewan winters. December 2011 was, with an average temperature of $-5.4^{\circ} \mathrm{C}$, the second warmest December recorded at the station. Only 1997 was warmer with an average temperature of $-4.5^{\circ} \mathrm{C}$.

Monthly precipitation was above normal for February, June, July and October. Yearly precipitation was $90 \%$ of normal. The greatest daily precipitation occurred on July $12^{\text {th }}$ when 39.5 mm was recorded. Snow-on-the-ground lingered until March $31^{\text {st }}$ when there was still enough to be measured. Snowfall was most notable by its absence during the months of November and December. By the end of December, only 2 cm had accumulated on the ground. The number of days with precipitation was $11 \%$ higher than normal with January and June having more than half their days experiencing some form of precipitation. Seasonally, 2011 was the $5^{\text {th }}$ driest spring since 1964 ; a pronounced contrast to last year's wettest spring.

2011 produced a record year for bright sunshine. The instruments recorded 2686 hours or almost $60 \%$ of possible bright sunshine. All months, except January, were above normal for hours of bright sunshine. September recorded 15 days when the ratio between hours and possible hours was over $90 \%$ and 27 days when bright sunshine exceeded the daily normal. With 334 days with bright sunshine, 2011 ranked $4^{\text {th }}$ behind 1979, 1976 \& 1978 for the year with the most bright sunshine days. Spring, summer and autumn were in the top ten while winter was in the bottom ten for number of days.

Monthly average peak wind speeds for all months were between 40 and $47 \mathrm{~km} / \mathrm{h}$. The highest wind speed was recorded on June $17^{\text {th }}$ at $78.2 \mathrm{~km} / \mathrm{h}$; the only occurrence of Strong Gale force winds during the year. Winds were generally from the WNW with the highest average wind speeds also from the WNW. The highest wind chill occurred on February $1^{\text {st }}$ at -45 C .

a person is accustomed to $138^{\circ} \mathrm{F}$ in the shade, his ideas about cold weather are not valuable.... When in India, "cold weather" is merely a conventional phrase and has come into use through the necessity of having some way to distinguish between weather which will melt a brass door-lknob and weather which will only make it mashy.

Mark Twain-Following the Equator

## For Your Information

1. The 1971-2000 normals for CRS have been calculated from original data entered on computerized spread sheets and checked for correctness. Where suitable, missing data has been replaced with data from the University of Saskatchewan, Kernen Farm station ( 2.5 km E of SRC) and/or the Saskatoon Diefenbaker International Airport (DIA) station (10km WNW of CRS).
2. Wind normals are from the Saskatoon DIA station.
3. Global and Diffuse radiation normals are from 1961-1990 period.
4. Extreme values for temperature and precipitation are from the Saskatoon area weather stations extending back to 1882. The earlier records from 1882 to 1901 have several large gaps.
5. Data from the wind roses have been compiled using Mistaya's "Windographer ${ }^{\text {TM" }}$.
6. The bright sunshine recorder was calibrated during January - March period therefore, the values for those months have been estimated using the Global/Diffuse values. ( see Glossary of Terms; Bright Sunshine for methodology)

## For Your Information

The start of the new decade ushers in the shifting of the 30-year normals from 19712000 to 1981-2010. For January, the average temperatures are about $2^{\circ} \mathrm{C}$ warmer than the old normals while precipitation is slightly less. With this in mind, this January's average temperatures are less than $1^{\circ} \mathrm{C}$ above or below the new normals. On the $20^{\text {th }}$ and $31^{\text {st }}$ minimum temperatures drop below $-30^{\circ} \mathrm{C}$ but were offset by four days of maximum temperature above $0^{\circ} \mathrm{C}$. Precipitation was below normal even though there were 8 days more than usual that saw snow accumulations. This caused snow shovellers to wonder if it was ever going to quit. With 18 days of snow, it was surprising that the bright sunshine days were only 1 less than normal. The bright sunshine hours, however, were $25 \%$ or 26 hours less than normal. The snow depth of 21 cm is keeping the soil temperatures well above average, especially in the upper levels.

Weather Words for the Weatherwise
The January of 1980 saw the deepest average snow pack recorded at SRC's CRS. The 51 cm was sustained through February and did not disappear until April.

## For Your Information

February started with a low of $-31.8^{\circ} \mathrm{C}$ and in a matter of only three days rose to a high of $4.0^{\circ} \mathrm{C}$. This roller coaster continued throughout the month leaving people wondering whether shorts or snowsuits would be needed for any given day. Eight maximum temperatures rose above freezing while balancing this were an equal number of minimum temperatures less than $-27^{\circ} \mathrm{C}$ including three below $-30^{\circ} \mathrm{C}$. On average the temperatures were one to two degrees below normal. Snow blowers and shovels were again in regular use to remove the 25 cm of snow that accumulated on the ground. Snow fall was above normal. Even with eleven days of snow fall, the bright sunshine hours were above normal by $12 \%$. The month ended with blizzard like conditions.

## Weather Words for the Weatherwise

Blizzard- When winds of $40 \mathrm{~km} / \mathrm{hr}$ or greater are expected to cause widespread reductions in visibility to 400 metres or less, due to 6lowing \%** snow, or 6lowing snow in combination with * * falling snow, for at least 4 hours.

* 氺 Blowing snow- When snow, caused by winds of at least $30 \mathrm{~km} / \mathrm{h}$, is expected to reduce visibility to 800 metres or less for at least 3 hours. Environment Canada, 2010

## For Your Information

Like the old adage, March roared in like a lion and left like a lamb. Monthly temperature averages were $5^{\circ} \mathrm{C}$ colder than normal due to the extreme cold temperatures $\left(-30^{\circ} \mathrm{C}\right)$ at the beginning of the month. By month's end the temperature had risen sufficiently to be near the daily normal. There were no extreme temperature records set during March. Typical of March, precipitation came as both snow and rain on eleven occasions producing a below average month end total. The official start of spring on March 20th brought nothing but complaints of below average temperatures, unmelted snow banks, and icy streets. The only positive event during the month was the 16.5 hours of 'extra' bright sunshine. In fact, 10 days recorded at least $85 \%$ or more of possible bright sunshine.

Mild weather is not always welcomed in March. For Northern communities that rely on ice roads to bring in much needed supplies, a warm March can be disastrous. Record warm temperatures last March closed Manitoba ice roads after being open for less than a month. Previous years the northern residents had 60 days to bring in supplies but last year the ice roads were only usable for 20. Phillips, 2010

For Your Information
Even though April temperatures were just slightly below normal, the perception was a much colder month. Half the days recorded temperatures above $10^{\circ} \mathrm{C}$ as their maximum but the minimum temperatures only remained above $0^{\circ} \mathrm{C}$ for four nights. An early start to gardening was foiled with only 27.1 growing degree-day units; less than half of the normal monthly value. Early spring flowers struggled to bloom by month's end. The snow cover had generally disappeared by April $4^{\text {th }}$, with the first robins arriving by April $7^{\text {th }}$. Rain was sparse with thunderstorms observed on the $26^{\text {th }}$ and $27^{\text {th }}$. Pea-sized hail was reported with the later storm. Average wind speeds were strongest from the WNW/ NW, NNE and ESE/SE with the most frequent winds coming from SSW and WSW. The strongest wind of $60.8 \mathrm{~km} / \mathrm{h}$ from the north occurred on the $29^{\text {th }}$ midst an afternoon of Strong and Near Gale winds prevailing from the north to the northeast directions. Not even about 80 hours above the normal Bright Sunshine value could produce sunny dispositions among the gloomy gardeners this month.

## Weather Word for the

## For Your Information

Whether the daily weather was warm or wintry, the average monthly temperatures for May were very close to normal. Gardens were planted, yards raked, bedding plants bought and installed. Of course, then came the frost warnings. Rainfall, although frequent, was not plentiful with the monthly total below normal; the yearly amount is 65\% of normal. Bright sunshine values were $17 \%$ above normal with 12 days receiving more than $80 \%$ of the possible daily bright sunshine. Daily wind speeds measured above $40 \mathrm{~km} / \mathrm{hr} 14$ times, above $51 \mathrm{~km} / \mathrm{hr}$ thrice and over $63 \mathrm{~km} / \mathrm{hr}$ once during the month. The prevailing wind directions were from the NNE to the SE.
Spring is synonymous with kite flying due to favourable, steady winds. They have been used to gain an understanding of the atmosphere as early as 1749 when Alexander Wilson flew a kite to record air temperatures at different altitudes. Ben Franklin proved there was electricity in lightning with the aid of a kite and a key. In 1847, a kite was used to fly across the 244 m Niagara Gorge. The kite's string was the beginning of the first suspension bridge as a light cord, then a heavier cord, and then a rope and finally a wire cable were pulled across in succession. ${ }^{1}$

## For Your Information

While it's relatively easy to keep away from tornadoes in Canada, hailstorms are a entirely different matter. Hailstorm weather is far more common than tornadoes. The hailstorm season runs from May-September but you can expect hailstorms almost daily somewhere during July and Augus.. ${ }^{1}$

Southern inland British Columbia and southern Alberta experience far more frequent and severe hail storms than anywhere else in Canada. While that may be encouraging if you're not planning to travel to those areas, just be aware hail occurs anywhere in southern Canada. ${ }^{1}$

Temperatures, this July, climbed above $30^{\circ} \mathrm{C}$ on two occasions; July $18^{\text {th }}$ to $31.5^{\circ} \mathrm{C}$ and July $31^{\text {st }}$ to $34.4^{\circ} \mathrm{C}$. Four maximum temperature records were set during the month. The $8^{\text {th }}$ recorded a high minimum of $18.1^{\circ} \mathrm{C}$ (previous; $17.3^{\circ} \mathrm{C} / 2002$ ) as well as a high average of $23.4^{\circ} \mathrm{C}$ (previous; $23.1^{\circ} \mathrm{C} / 1970$ ). The $31^{\text {st }}$ recorded a high maximum of $34.4^{\circ} \mathrm{C}$ (previous; $33.9^{\circ} \mathrm{C} / 1973$ ) as well as high average of $24.8^{\circ} \mathrm{C}$ (previous; $24.1^{\circ} \mathrm{C} / 2005$ ). Only one minimum temperature was recorded; on the $22^{\text {nd }}$ a low maximum was set with $16.4^{\circ} \mathrm{C}$ (previous; $17.8^{\circ} \mathrm{C} / 1968$ ). Over all, temperatures were near normal. With the above monthly average of 72.8 mm of rain recorded, precipitation total for the year is near normal. A daily record was broken on the $12^{\text {th }}$ when 21.4 mm surpassed the 1986 mark of 17.2 mm . Near Gale winds $(51-62 \mathrm{~km} / \mathrm{h})$ or over occurred eight times with the highest measured from the NW at $68 \mathrm{~km} / \mathrm{h}$ on the $20^{\text {th }}$ during thunderstorm activity.
Throughout ancient history, thunder and lightning has been attributed to the gods. To the Greeks, it was Zeus and Brontes; to the Romans, it was Jupiter and Summanus. In northern Europe, it was the German Donar, Norwegian Thor or the Finnish Perkele who controlled thunder and lightning. The Native Americans assigned the phenomenon to the Thunderbird. ${ }^{1}$ The most unusual explanation comes from the Catskill Mountains region of New York as recounted by Washington Irving in his tale of Rip Van Winkle. Thunder and lightning result when ninepin bowling is played up in the mountains by the spirits of the area's explorer Henry Hudson and crew. Thunder is the rumble of rolling balls while lightning is pins being knocked down. ${ }^{2}$

August 2011 was warm but not hot with only one recorded temperature value over $30^{\circ} \mathrm{C}$. On average, temperatures were only $1^{\circ} \mathrm{C}$ above normal. The August total precipitation recorded at CRS was well below normal with 20.8 mm . Throughout the city, as reported by colleagues, rainfall was very variable. On the $15^{\text {th }}$, along with large hail stones, up to 35 mm of precipitation was observed while at CRS only 5.8 mm was recorded. Bright sunshine radiation was $25 \%$ above normal ( 338.2 hours) with all days recording bright sunshine. Winds were most frequent from WNW with the strongest average wind speeds coming from the WNW and NW directions. Only seven days had wind speeds over 40 km/hr.

Weather Words for the Weatherwise

## Hot Spang

A sudden power of heat from the sun emerging from a cloud.

## Glecamy

Showery weather with bright intervals. From 'gleam', a hot interval of sunshine between showers; a ray of sunshine. ${ }^{1}$

## For Your Information

Sun, soleil or sol, no matter what you call it, September had a record abundance. Every day experienced some bright sunshine with 15 days recording over $90 \%$ of possible bright sunshine. With a monthly total of 302.2 hours, it easily outshone the previous 2009 record of 266.4 hours. September also overshadowed previous records set for days with greater than 5 hours ( 28 days) and days with greater than 10 hours ( 18 days) of bright sunshine. Complimenting these brilliant days were unseasonable temperatures soaring to over $30^{\circ} \mathrm{C}$ on seven occasions setting four new extreme maximum temperature records along with two high daily minimum temperature records. Frost occurred on the 14th ending the frost free season at 126 days. Precipitation was well below normal allowing for a perfect month for harvest. Harvesters were able to work well into the night reaping this year's various crops under a beaming harvest moon.

The Harvest Moon is the full moon closest to the autumnal equinox and occurs in September two out of three years. When it occurs in October, the September moon is then referred to as the Corn Moon, a folkloric connection indicating the time when corn, pumpkins, squash, beans and wild rice were traditionally ready to be harvested. ${ }^{1}$

## For Your Information

Averaging the November temperatures produced a mean almost $2^{\circ} \mathrm{C}$ above the monthly normal but that does not give a true picture of the variation experienced. The extreme high of $12.4^{\circ} \mathrm{C}$ on the $3^{\text {rd }}$ was negated by the extreme low $-23.6^{\circ} \mathrm{C}$ on the $20^{\text {th }}$. The month began with temperatures near normal until the $15^{\text {th }}$ when they began their slide to the extreme minimum. By the $21^{\text {st }}$, a recovery had begun, ending the last third of the month well above normal. During this period two maximum temperatures were set; on the $23^{\text {rd }}, 9.1^{\circ} \mathrm{C}$ surpassed the old 1976 record of $8.3^{\circ} \mathrm{C}$ and on the $27^{\text {th }} 11.2^{\circ} \mathrm{C}$ doubled the previous record of $5.6^{\circ} \mathrm{C}$ set in 1968 . Twenty days recorded temperatures above $0^{\circ} \mathrm{C}$ but there were no frost-free days or growing degree-days. Precipitation was below normal allowing the yearly total to slip to $92.7 \%$ of normal. The site recorded Near Gale winds on six occasions with the peak wind occurring on November $25^{\text {th }}$ at $60.9 \mathrm{~km} / \mathrm{h}$. Bright sunshine was above normal with 20 days reporting more than one hour of bright sunshine.

National security was stepped up a notch during this month in 1941. The powers-that-be decreed that all newspapers were not to publish any reference to weather conditions. Editors of a Winnipeg paper complained "When you confront one of those old-fashioned blizzards that stall trains and leave motorists stranded, what are we going to do if we can't talk about it?"1
${ }^{1}$ Phillips, 2010

For Your Information
December 2011 was very reminiscent of December 1997 when snow was absent and temperatures were also well above normal. Four new daily maximum records broke the old records by as much as $5^{\circ} \mathrm{C}$. Sixteen days posted temperatures above freezing of which 11 were in the last half of the month. A ground cover of snow was generally lacking throughout the month due to the warm weather and dearth of new snow. The monthly precipitation total was well below normal concluding the year with a $10 \%$ shortfall from normal. All soil levels showed temperatures 1 to $2^{\circ} \mathrm{C}$ above normal with the frost penetrating the soil to the 50 cm level by the latter half of the month. Bright sunshine was evident throughout the month with only six days devoid of any bright sunshine. Unfortunately, the majority of those days occurred during the last week when children were on the holiday break.
When snow is lacking, ski hill operators are forced to make the stuff artificially for their die-hard clients. One of the earliest ventures was in Canada when 75 tonnes of "snow" were shaved off a skating rink and used to cover a ski jump and hill allowing for the 1934 ski jump competition to go forward. ${ }^{1}$

# INSTRUMENTS USED AT SASKATOON SRC CRS AND GLOSSARY OF TERMS 

(Unless otherwise stated, source for definitions of terms is Environment Canada, 1978)
BEAUFORT WIND SCALE was developed by Admiral Sir Francis Beaufort in 1805 and adopted by the British Navy in 1838. It consisted of 13 degrees of wind strength, from calm to hurricane, based upon the effects of various wind strengths upon the amount of canvas carried by the fully rigged frigates of the period. Over the years it has been modified as needed and in 1946 the scale values (Force Numbers) were defined by ranges of wind speed as measured at a height of 10 meters above the surface. In effect, this transformed the 'Beaufort Wind Force Scale’ into the 'Beaufort Wind Speed Scale’. This scale is the current standard scale for visual observations of the wind (Heidorn, 1998).

BRIGHT SUNSHINE is the unobstructed direct radiation from the sun, as opposed to the shading of a location by clouds or by other atmospheric obstructions.
Number of Days is defined as the total number of days when at least 0.1 of an hour of bright sunshine was recorded.
Percentage Possible refers to the ratio of measured bright sunshine hours to the total possible daylight hours in a given period, expressed as a percentage.
Possible daylight hours are taken from the sunrise/set tables provided by the National Research Council of Canada, Herzberg Institute of Astrophysics, Victoria, BC.
Total is the sum of the daily bright sunshine values in hours and tenths of hours as measured by an automated sunshine recorder using voltaic cells.

DEGREE-DAY is an index for various temperature related calculations
Cooling (CDD) is the cooling requirement to achieve a stipulated comfort value in an indoor environment. For most purposes, a temperature of greater than $18^{\circ} \mathrm{C}$ is considered uncomfortable and supplementary cooling is required. On a specific day, the amount by which $18^{\circ} \mathrm{C}$ is less than the daily average temperature defines the number of cooling degree-days for that day.
Mathematically:CDD $=\left(\mathrm{T}-18^{\circ} \mathrm{C}\right)$, for that day, where $\mathrm{T}=$ daily mean temperature in ${ }^{\circ} \mathrm{C}$ if T is equal to or less than $18^{\circ} \mathrm{C}, \mathrm{CDD}=0$. Monthly and annual values of CDD are obtained by summing daily values.
Growing (GDD) is the growing requirement in order for plant growth to proceed. The air temperature must exceed a critical value appropriate to the plant species in question. For many members of the grass family, including most commercial cereals grown on the prairies, a base temperature of $5.0^{\circ} \mathrm{C}$ has been established. On a specified day, the difference between the daily average temperature and the $5.0^{\circ} \mathrm{C}$ base temperature defines the number of growing degree-days.
Mathematically: $\mathrm{GDD}=\left(\mathrm{T}-5.0^{\circ} \mathrm{C}\right)$, for that day, where $\mathrm{T}=$ daily mean temperature in ${ }^{\circ} \mathrm{C}$ if T is equal to or less than $5.0^{\circ} \mathrm{C}, \mathrm{GDD}=0$. Daily GDD values are summed to provide totals for the appropriate month, growing season or year.
Heating (HDD) is the heating requirement to achieve a stipulated comfort value in an indoor environment. For most purposes, a temperature of less than $18^{\circ} \mathrm{C}$ is considered uncomfortable and supplementary heating is required. On a specific day, the amount by which $18^{\circ} \mathrm{C}$ exceeds the daily average temperature defines the number of heating degree-days for that day.
Mathematically:
HDD $=\left(18^{\circ} \mathrm{C}-\mathrm{T}\right)$, for that day, where $\mathrm{T}=$ daily mean temperature in ${ }^{\circ} \mathrm{C}$ if T is equal to or greater than $18^{\circ} \mathrm{C}, \mathrm{HDD}=0$. Monthly and annual values of HDD are obtained by summing daily values.

EXTREME is the highest or lowest value of a particular element recorded during the period in question.
EXTREME ALL YEARS Temporal comparisons at a point are also of value in some types of climatic studies. Therefore, it is desirable to produce the maximum length of reliable climatic record to carry out studies over a period of time. Data are drawn mainly from the following data sets:
SRC:1963 to present
Saskatoon Airport: 1942 to present
University of Saskatchewan:1916 to 1963
Eby station: 1901-1941
NWMP: circa1892 to circa 1900 (sporadic)
Station locations, exposures and measurement procedures were subject to change during this time period. Data are not adjusted and users are cautioned accordingly.

FROST is recorded on each occasion when the daily minimum temperature is equal to or less than $0^{\circ} \mathrm{C}$.

NORMAL VALUE (1981-2010) In climatology it is often useful to make spatial comparisons of particular element values over a common time period. At an interior continental site such as Saskatoon, a period of 30 years is required to produce statistically stable estimates of the more variable elements. To facilitate spatial comparisons, the World Meteorological Organization recommends the standard normal (average) period of thirty years. The current normal period for data analysis at CRS is from January 1 ${ }^{\text {st }}, 1981$ to December 31 ${ }^{\text {st }}$, 2010. Data derived from CRS conform to this standard, except where noted. The normals for CRS have been calculated using the data collected during this standard period. Where gaps existed, data from the nearest climate station were used and referenced as to being used. (Environment Canada, 1993, 2002, 2004a)

POTENTIAL EVAPOTRANSPIRATION (Thornthwaite Method) is the amount of water which will be lost from a surface completely covered with vegetation if there is sufficient water in the soil at all times for the use of the vegetation. It is computed by means of an empirical formula involving mean monthly temperature and average length of day.
Mathematically:PET = $\mathrm{mT}^{\mathrm{a}}$ where PET = Potential of Evaportranspiration; $\mathrm{m}=\%$ of day length for the month as compared to the year; $\mathrm{T}=$ Temperature ${ }^{\circ} \mathrm{C}$ when T is less than or equal to 0 ; otherwise $\mathrm{T}=\mathrm{O}$; and $\mathrm{a}=$ yearly heat index. (Thornthwaite and Mather, 1955)

## PRECIPITATION

Day is recorded on occasions when the amount of precipitation in a 24-hour period equals or exceeds 0.2 mm water. An asterisk (*) appearing in the average column denotes the occurrence of measurable precipitation on one or more occasions, and that the calculated 30-year average amounts to less than a trace. The so-called climatological day, beginning at 9 a.m. standard time on the date of reference and ending at 9 a.m. the next morning, was employed in record keeping up to January 1994. On February 1, 1994, after consultation with Environment Canada, record keeping was changed to the 24 -hour period of 0000 hours -2400 hours to conform to their reporting of climatological statistics.
Total is the sum of the daily recorded precipitation. The snowfall component of precipitation is recorded as an equivalent amount of liquid water. The notation "T" refers to a trace of precipitation (less than 0.2 mm water equivalent). As of August 7, 1993, total precipitation was measured using a weighing gauge for the winter season and the tipping bucket during frost-free period.

SEASONS Meteorologists prefer to divide the year into four 3-month periods based primarily on temperature. Thus winter is defined as December (previous year), January, and February (DJF); spring as March, April and May (MAM); summer as June, July and August (JJA); and fall as September, October and November (SON). (Lutgens and Tarbuck, 1992)

SOIL TEMPERATURE under a short grass surface with normal snow accumulation, is measured according to procedures outlined in the Environment Canada publication "Soil Temperature" January l, 1976. Depths below surface at which soil temperature measurements are made are: $5 \mathrm{~cm}, 10 \mathrm{~cm}, 20 \mathrm{~cm}, 50 \mathrm{~cm}, 100 \mathrm{~cm}, 150 \mathrm{~cm}$ and 300 cm . Since soil temperature is affected by profile structure and water content, extrapolation of the measured data is difficult.

## SOLAR RADIATION

Diffuse - Total is radiation reaching the earth’s surface after having been scattered from the direct solar beam. The instrument used is an Eppley pyranometer with a shade ring (See SOLAR RADIATION-Global- Total).
Global - Total is the sum of the direct solar and diffuse radiation during the period in question. Measurements are carried out on a horizontal surface near ground level and integrated over the whole celestial dome, summing the diffuse and direct components of the solar beam. The temperature-compensated Eppley pyranometer is used. The standard metric unit of measurement is the megajoule per square metre ( $\mathrm{MJ} / \mathrm{m}^{2}$ ). (To facilitate comparison with past years' data: $1.0 \mathrm{MJ} / \mathrm{m}^{2}=23.895$ langleys). Comparison is provided with a provisional average based on 16 years of data (1975-1990).

SPELLS - Temperature spells are defined as days when the daily maximum temperature is higher than or equal to $30^{\circ} \mathrm{C}$ (hot spell) or the daily minimum temperature is lower than or equal to $-30^{\circ} \mathrm{C}$ (cold spell).

SUNRISE/SUNSET times have been included in this report. They have been acquired from the National Research Council, Canada, Herzberg Institute of Astrophysics.

## TEMPERATURE

Average Annual is the average of the daily average temperatures in degrees Celsius ( ${ }^{\circ} \mathrm{C}$ ) for one year.
Average Daily is defined as the arithmetic mean of the daily maximum temperature in degrees Celsius $\left({ }^{\circ} \mathrm{C}\right)$ and the daily minimum temperature in degrees Celsius $\left({ }^{\circ} \mathrm{C}\right)$ for the day in question.
Average Maximum is the average of the daily maximum temperatures in degrees Celsius $\left({ }^{\circ} \mathrm{C}\right)$ average over the appropriate time periods
Average Minimum is the average of the daily minimum temperatures in degrees Celsius $\left({ }^{\circ} \mathrm{C}\right)$ averaged over the appropriate time periods. Refer to TEMPERATURE-Average Maximum concerning measurement procedures.
Average Monthly is the average of the daily average temperatures in degrees Celsius $\left({ }^{\circ} \mathrm{C}\right)$ for the month under consideration.

WIND CHILL describes a sensation, the way we feel as a result of the combined cooling effect of temperature and wind. This feeling can't be measured using an instrument, so a mathematical formula was developed in 1939 that related air temperature and wind speed to the cooling sensation. This formula was revised in 2001 by a team of scientists and medical experts from Canada and the U.S. with the Canadian Department of National Defence contributing human volunteers. The new index is based on the loss of heat from the face (Environment Canada 2004b).

WAVES - Temperature waves are defined as a sequence of three or more days when the daily maxiumum/minimum temperatures are higher/lower than, or equal to, a set temperature. For a heat wave the temperature is $32^{\circ} \mathrm{C}$.
(Environment Canada 2005).

## WIND SPEED

Average is the average of the hourly wind speeds for the period in question measured in kilometres per hour (km/h). Average hourly wind speeds are obtained from a RM Young Wind Monitor anemometer at a height of 10 m .

Peak Gust refers to the highest instantaneous value recorded by the anemometer system for the period of reference, irrespective of direction and/or duration. Comparison is with published data for Environment Canada, Saskatoon Airport station.
see also Beaufort Wind Scale
